Intricacies

Conclusion

Recommender systems are...

Information filtering systems that seek to **predict the 'rating' or 'preference'** that a user would give to an item (such as music, books, or movies) or social element (e.g. people or groups) they had **not yet considered**, using a model built from the characteristics of an item or the **user's social environment**.

Where are they used ?

Mostly in e-commerce. . .

Where are they used ?

Mostly in e-commerce. . .

- **Netflix** suggests movies based on user's previous behavior, user's movie preferences, movie genre and peer ratings.

Where are they used ?

Mostly in e-commerce. . .

- **Netflix** suggests movies based on user's previous behavior, user's movie preferences, movie genre and peer ratings.
- **Amazon** suggests books based on user's reading habits, user's book genre preferences.

Where are they used ?

Mostly in e-commerce. . .

- **Netflix** suggests movies based on user's previous behavior, user's movie preferences, movie genre and peer ratings.
- **Amazon** suggests books based on user's reading habits, user's book genre preferences.
- **Flipkart** suggest electronics and books based on user's previous purchases and based on what other user's with similar preferences bought.

Collaborative filtering is...

What is Collaborative filtering?

Collaborative filtering is...

A machine learning algorithm that predicts movie ratings for new users (speaking in the context of the movie recommendations system) based on some (possibly none) movies in the database that they have already rated and also based on movie ratings by other users in the systems social environment. These predicted ratings can then be used to recommend top rated movies to the new user.

Introduction
